PRODUCTS

1. Transformer Oil Filter Machine

Leading manufacturer and supplier of transformer oil filter machines for oil purification, dehydration, degassing, and BDV improvement applications.

Our **Transformer Oil Filter Machine** is a high-performance **vacuum oil filtration and purification system** designed to remove **moisture, dissolved gases, sludge, carbon particles, and impurities** from transformer insulating oil. The machine restores the oil's **dielectric strength (BDV)** and improves the overall performance, safety, and life of power transformers.

Using advanced **vacuum dehydration, degassing, and multi-stage fine filtration technology**, the system ensures efficient purification of transformer oil for both **new transformer oil filling** and **used oil reclamation during maintenance**.

This machine is widely used by **transformer manufacturers, power utilities, electrical maintenance contractors, service providers, and industrial plants** for the filtration of oil in **power transformers, distribution transformers, OLTC compartments, reactors, and other oil-filled electrical equipment**.

Key Features of Transformer Oil Filter Machine

- High-efficiency **vacuum dehydration system**
- Effective **degassing of dissolved gases**
- Removes **free water and dissolved moisture**
- Multi-stage **fine micron filtration**
- Improves **BDV / dielectric strength**
- PLC, HMI and SCADA based automatic operation
- Low maintenance and energy-efficient design
- Portable skid-mounted, Trolley based and Vehicle Mounted models available
- Suitable for **online and offline filtration**
- Available in multiple capacities ranging from 200 LPH to 20000 LPH**.**

Applications

Our **Transformer Oil Filtration Machine** is ideal for:

- Transformer oil purification
- Oil dehydration and degassing
- Transformer oil filling during manufacturing
- Preventive maintenance of transformers
- On-site filtration services

- Transformer oil circulation during testing
- Oil recovery and reconditioning

Benefits

- Extends transformer life
- Improves insulation performance
- Reduces transformer failure risk
- Enhances operational reliability
- Lowers maintenance cost
- Ensures uninterrupted power system performance

Why Choose Our Transformer Oil Filter Machine?

Designed with robust engineering and reliable vacuum technology, our system delivers **consistent oil purification performance** for transformer manufacturers and service companies. We provide **customized capacities, long-term service support, and durable industrial-grade equipment** for critical power sector applications.

2. Online Dry Out system

It is mounted with the transformer and continuously draws oil from the tank, removes moisture through an adsorbent medium, and returns dry oil to the top of the transformer.

The On-Line Drying Out System is designed to remove moisture and contaminants from transformer insulating oil while the transformer remains in operation. The system circulates oil through specialized adsorption media and filtration units to eliminate moisture and impurities without interrupting power supply.

By maintaining dryness in both oil and insulation, it improves dielectric strength, slows insulation ageing, reduces sludge formation, and extends transformer service life without affecting DGA results.

Key Features

- Continuous online drying without transformer shutdown
- Compact and easy-to-operate design
- Moisture removal using specialized adsorption media
- High-efficiency filtration elements
- Continuous oil circulation system
- Digital moisture monitoring in PPM

- Low maintenance with easy cartridge replacement
- Sealed system to prevent moisture ingress and contamination
- PLC-based automatic control system
- Audio / visual alarm and protection system
- Suitable for permanent or temporary installation
- Optional stainless-steel construction for outdoor use

Applications

- New transformers: Maintaining factory dryness
- Middle-age transformers: Improving insulation life
- Spare transformers: Maintaining dryness during idle condition
- Regenerated / desludged transformers: Maintaining achieved dryness levels
- Oil storage tanks: Maintaining dryness of stored oil
- Continuous moisture removal from transformer oil and insulation
- Maintaining low moisture levels in operating transformers
- Extension of transformer insulation service life
- Power and distribution transformers
- Electrical substations and utility maintenance
- Preventive maintenance of transformers
- Improvement of dielectric strength of insulating oil
- Long-term moisture control of transformers

3. Turbine / Lubricating Oil Filtration & Purification System

The Turbine / Lubricating Oil Purification System is designed to efficiently remove water, sludge, and solid contaminants from turbine and industrial lubricating oils. The system operates on a combination of centrifugation and low vacuum dehydration technology, ensuring effective oil cleaning without affecting its properties.

Lubricating oil typically does not wear out but gradually loses its performance due to contamination from dirt, sludge, metal particles, and moisture. This system continuously processes the oil by drawing it from the tank, purifying it, and returning clean oil back to the same system. The centrifugal separation removes free water and heavy contaminants, while the dehydration system reduces moisture content up to **≤ 50 PPM**, restoring oil quality and extending equipment life.

The plant is available in capacities ranging from **500 LPH to 10,000 LPH**, and can be supplied in both **stationary (skid-mounted)** and **mobile configurations**, suitable for indoor and outdoor applications.

Key Features

- Combination of centrifuge separator and vacuum dehydration system
- Continuous online oil purification and recirculation
- • Removal of free water, emulsified water, and sludge
- • Moisture reduction up to ≤ 50 PPM
- • High-efficiency filtration for fine particulate removal
- • Compact, user-friendly, and easy-to-operate design
- • Low maintenance with long-life filtration elements

- • Available in skid-mounted or mobile (castor / pneumatic wheels) versions
- • Suitable for indoor and outdoor installation

Advanced / Optional Features

• Auto / manual operation with optional PLC-based automatic control system
• Online moisture monitoring (PPM indication)
• High-efficiency absolute particulate filtration
• Foam sensor with knockdown protection circuit
• Dual tank system with automatic condensate water drain
• Audio / visual alarm and protection system

Machine Features

• Advanced cooling system for vapor condenser
• High dirt-holding capacity filtration elements for fine and coarse particles
• Efficient electric heating with low watt density and uniform heating
• Safety interlocks with oil pump, heater, flow switch, and level sensor
• Special dehydration system ensuring maximum oil exposure to vacuum

Applications

• Turbine oil / mineral oil purification
• Hydraulic oil, lube oil, and compressor oil treatment
• Steel plants and heavy industries
• Rolling mills
• Paper mills
• Varnish and sludge removal from oil systems
• Hydro power generating stations
• Preventive and routine maintenance of lubrication systems

Why Choose Our Turbine / Lubricating Oil Filtration System?

Designed for demanding industrial environments, our **oil filtration systems** provide reliable purification performance, robust construction, and long-term service support. We offer **customized capacities, portable designs, and application-specific filtration solutions** for power and process industries.

4.Vacuum Drying Plant

Our **Vacuum Drying Plant** is a high-performance industrial drying system designed for the **efficient removal of moisture, gases, and volatile contaminants** from transformer active parts, windings, cores, insulation materials, and other electrical components. Built for critical drying applications in the power and electrical manufacturing industry, the system ensures superior insulation quality and long-term equipment reliability.

The plant uses **deep vacuum technology combined with controlled heating and precise temperature management** to achieve rapid and uniform drying of transformer components. By reducing residual moisture content in solid insulation and active parts, the vacuum drying

process improves **dielectric strength, insulation resistance, and overall transformer performance**.

This system is widely used by **transformer manufacturers, motor and generator manufacturers, electrical equipment OEMs, and repair service providers** for drying components before oil filling, VPI processing, and final assembly.

Key Features of Vacuum Drying Plant

- High-efficiency **deep vacuum drying system**
- Uniform heating for fast moisture removal
- Controlled temperature and vacuum cycle operation
- PLC / HMI based automatic control system
- Suitable for **transformer active part drying**
- Robust chamber construction with thermal insulation
- Energy-efficient heating system
- Low maintenance and continuous-duty design
- Custom chamber sizes and capacities available
- Compatible with **transformer manufacturing and repair applications**

Applications

Our **Vacuum Drying Plant** is ideal for:

- Transformer active part drying
- Core and coil drying
- Winding insulation drying
- Drying before transformer oil filling
- Electrical motor and generator drying
- Pre-VPI moisture removal
- Repair and refurbishment drying process

Benefits

- Removes deep-seated moisture effectively
- Improves insulation performance
- Enhances dielectric strength
- Reduces failure risk in transformers
- Increases product life and reliability
- Improves manufacturing quality standards
- Reduces downtime during repair cycles

Why Choose Our Vacuum Drying Plant?

Designed for demanding industrial use, our **Vacuum Drying Plant for transformers and electrical equipment** offers reliable drying performance, precise process control, and long-term durability. It is engineered to meet the needs of **transformer OEMs, repair workshops, and power equipment manufacturers** requiring consistent and efficient moisture removal.

5.Heating Oven

Our **Industrial Heating Oven** is a high-performance thermal processing system designed for **uniform heating, drying, curing, baking, and preheating applications** across transformer manufacturing, electrical equipment, and Motors. Engineered for precision temperature control and consistent heat distribution, the oven ensures reliable processing of components, coils, insulation materials, and metal parts.

The system is widely used in the **transformer industry, motor and generator manufacturing, insulation drying, and industrial fabrication units**. With robust insulation, controlled airflow, and energy-efficient heating elements, the oven provides uniform temperature throughout the chamber for improved process quality and reduced cycle time.

Our heating ovens are available in **customized chamber sizes, temperature ranges, and loading capacities**, making them suitable for both batch and continuous industrial operations.

Key Features of Heating Oven

- Uniform temperature distribution throughout the chamber
- High-efficiency electric heating system
- Precision digital temperature controller
- PLC / HMI based automatic operation (optional)
- Excellent thermal insulation for energy saving
- Heavy-duty industrial construction
- Adjustable temperature range for multiple applications
- Fast heating and stable temperature holding
- Custom chamber size and tray configuration available
- Low maintenance and long service life

Applications

Our **Industrial Heating Oven** is ideal for:

- Transformer coil heating and drying
- Insulation material drying
- Core and winding preheating
- Powder coating curing
- Paint baking and curing
- Component drying after washing
- Metal part preheating
- Industrial batch heating processes

Benefits

- Ensures uniform heating quality
- Reduces moisture and residual humidity
- Improves process consistency
- Enhances product quality
- Reduces cycle time
- Lowers energy consumption
- Increases production efficiency

Why Choose Our Heating Oven?

Designed for demanding industrial environments, our **Heating Oven for transformer and electrical applications**delivers consistent thermal performance, robust build quality, and reliable long-term operation. We provide **customized oven solutions based on size, temperature, and process requirements**, backed by strong engineering and service support.

6.Transformer Vacuum (Evacuation) Pumping System

Our Transformer Vacuum (Evacuation) Pumping System is designed for efficient air evacuation, moisture removal, and deep vacuum creation inside transformer tanks and oil-filled electrical equipment. It is used prior to oil filling, commissioning, testing, and maintenance to achieve the required vacuum level and ensure reliable transformer performance.

The system uses high-capacity vacuum pumps and controlled evacuation to remove air, trapped gases, humidity, and residual moisture from the transformer tank, active parts, and connected piping. **This process improves insulation quality, increases insulation**

resistance (IR value), and minimizes the risk of partial discharge, insulation failure, and moisture-related breakdowns.

Transformer life largely depends on the insulation condition of windings. Moisture absorption in insulation is one of the main reasons for reduced IR value. Vacuum drying without heating effectively removes this moisture, helping maintain insulation strength for high voltage and high current applications.

Widely used by transformer manufacturers, utilities, repair workshops, EPC contractors, and service providers, the system is suitable for power transformers, distribution transformers, reactors, OLTC compartments, and other oil-filled equipment.

Key Features of Transformer Vacuum (Evacuation) Pumping System

- High-capacity **deep vacuum pumping system**
- Fast evacuation of transformer tank and pipelines
- Effective removal of air, moisture, and gases
- Suitable for **pre-oil filling evacuation**
- Robust industrial vacuum pump assembly
- PLC / HMI based automatic control (optional)
- Vacuum gauges and monitoring instruments
- Portable skid-mounted design for site use
- Low maintenance and energy-efficient operation
- Available in customized pumping capacities

Applications

Our **Transformer Vacuum Pumping System** is ideal for:

- Transformer tank evacuation
- Pre-oil filling vacuum creation
- Transformer commissioning
- Transformer repair and servicing
- Moisture removal from active parts
- Pipeline and chamber evacuation
- Utility and substation maintenance

Benefits

- Improves insulation reliability

- Removes trapped air and moisture
- Prevents dielectric failure
- Enhances transformer life
- Reduces commissioning time
- Improves oil filling quality
- Ensures safe and efficient operation

Why Choose Our Transformer Vacuum Pumping System?

Designed for critical transformer manufacturing and field service applications, our **vacuum evacuation system** delivers reliable deep vacuum performance, fast processing, and durable industrial construction. We offer **customized capacities, portable designs, and long-term service support** for transformer OEMs and power sector clients.

7.Transformer Air Dryer

Our **Transformer Air Dryer** is a high-performance moisture control system designed to maintain **dry, clean, and moisture-free air inside transformer conservator tanks and oil-filled electrical equipment**. It helps prevent the ingress of atmospheric moisture into transformer oil, thereby preserving the **dielectric strength and insulation quality** of the transformer.

The system works by passing incoming air through a **desiccant-based drying chamber**, typically using **silica gel or molecular sieve**, which absorbs moisture before the air enters the conservator tank. This ensures that only dry air comes in during oil level fluctuations caused by load changes and temperature variations.

Widely used by **transformer manufacturers, utilities, substations, power plants, and maintenance service providers**, the transformer air dryer is essential for extending transformer life and reducing moisture-related insulation failures.

Key Features of Transformer Air Dryer

- Efficient **desiccant-based moisture absorption system**
- Prevents moisture ingress into transformer oil
- Maintains dry air inside conservator tank
- Transparent chamber for desiccant condition monitoring
- Compatible with **silica gel / molecular sieve**
- Heavy-duty corrosion-resistant construction
- Low maintenance and easy desiccant replacement
- Compact and robust design
- Suitable for indoor and outdoor installations

- Available in multiple sizes and capacities

Applications

Our **Transformer Air Dryer** is ideal for:

- Power transformers
- Distribution transformers
- Conservator tank moisture control
- Utility substations
- Industrial transformer installations
- Preventive maintenance systems
- Oil-filled electrical equipment

Benefits

- Protects transformer oil from moisture contamination
- Improves dielectric strength of oil
- Enhances insulation life
- Reduces transformer failure risk
- Lowers maintenance cost
- Increases transformer reliability
- Extends service life of equipment

Why Choose Our Transformer Air Dryer?

Designed for critical transformer applications, our **air dryer system** ensures reliable moisture protection and long-term performance. With robust construction, efficient drying media, and easy maintenance, it is an ideal solution for **transformer OEMs, utilities, and service companies**.

8.Vacuum Pressure Impregnation (VPI) Plant

Leading manufacturer and supplier of Vacuum Pressure Impregnation Plants for transformer coils, motors, generators, and electrical winding insulation applications.

Our **Vacuum Pressure Impregnation (VPI) Plant** is a high-performance industrial system designed for the **impregnation of transformer coils, motors, stators, rotors, electrical**

windings, and insulation components with varnish or resin under controlled vacuum and pressure conditions. The system ensures deep penetration of insulating material into the windings, eliminating air pockets and enhancing the electrical, thermal, and mechanical strength of the component.

The VPI process combines **deep vacuum drying, controlled resin filling, pressure impregnation, and curing preparation**, enabling complete insulation treatment for high-voltage electrical equipment. This process significantly improves **dielectric strength, moisture resistance, heat dissipation, and service life**.

Widely used by **transformer manufacturers, motor and generator OEMs, electrical equipment manufacturers, repair workshops, and insulation processing industries**, the VPI plant is ideal for high-reliability applications in the power sector.

Key Features of Vacuum Pressure Impregnation Plant

- Advanced **vacuum and pressure impregnation system**
- Deep penetration of varnish / resin into windings
- High-efficiency vacuum drying chamber
- Controlled pressure cycle for uniform impregnation
- PLC / HMI based automatic control system
- Resin storage and transfer system
- Heavy-duty pressure vessel construction
- Energy-efficient and low maintenance design
- Custom chamber sizes and capacities available
- Suitable for batch and continuous industrial applications

Applications

Our **VPI Plant** is ideal for:

- Transformer coil impregnation
- Motor stator and rotor impregnation
- Generator winding insulation
- Electrical coil varnishing
- High-voltage winding treatment
- Repair and refurbishment applications
- Insulation strengthening process

Benefits

- Improves dielectric strength
- Enhances moisture resistance
- Increases mechanical bonding of windings
- Improves heat dissipation
- Reduces insulation failure risk
- Extends equipment life
- Improves product reliability and performance

Why Choose Our VPI Plant?

Designed for critical insulation processing applications, our **Vacuum Pressure Impregnation Plant** offers reliable vacuum performance, precise pressure control, and consistent impregnation quality. We provide **customized chamber sizes, automation options, and long-term service support** for transformer and electrical equipment manufacturers.

9.Casting Impregnation Plant | Metal Impregnation Plant

Leading manufacturer and supplier of casting and metal impregnation plants for porosity sealing, leak-proof casting treatment, and industrial component quality improvement.

Our **Casting / Metal Impregnation Plant** is a high-performance industrial system designed for the **sealing of porosity, micro-leakage paths, and surface voids in metal castings and machined components**. The plant uses advanced **vacuum and pressure impregnation technology** to penetrate sealant deep into porous structures, ensuring leak-proof, pressure-tight, and high-reliability metal components.

This system is widely used for **aluminium, cast iron, steel, die-cast, and powder metal components**, where internal porosity can lead to fluid leakage, pressure loss, or reduced mechanical integrity. By filling microscopic pores and cracks with specialized resin or sealant, the plant significantly improves product quality, durability, and acceptance rates.

Widely used by **automotive manufacturers, foundries, casting units, pump and valve manufacturers, compressor OEMs, hydraulic component suppliers, and engineering industries**, the metal impregnation plant is ideal for mass production as well as high-precision industrial applications.

The system is specially designed for **porosity sealing of cast metal components** used in pressure and fluid applications.

Key Features of Casting / Metal Impregnation Plant

- Advanced **vacuum pressure impregnation system**
- Effective sealing of casting porosity and micro-cracks
- Deep penetration of sealant into internal voids
- Suitable for **aluminum, iron, steel, and die-cast parts**
- PLC / HMI based automatic control system
- Heavy-duty pressure vessel and vacuum chamber
- Resin / sealant storage and transfer system
- Fast processing cycle for production lines
- Low maintenance and energy-efficient operation
- Custom chamber sizes and automation options available

Applications

Our **Metal Impregnation Plant** is ideal for:

- Automotive engine components
- Pump and valve bodies
- Compressor housings
- Hydraulic and pneumatic components
- Die-cast aluminum parts
- Pressure-tight castings
- Powder metallurgy parts
- Industrial machine components

Benefits

- Seals internal porosity effectively
- Prevents oil, air, gas, and fluid leakage
- Improves pressure retention
- Enhances casting reliability
- Reduces rejection and scrap rate
- Improves product life and quality
- Increases customer acceptance and performance standards

Why Choose Our Casting / Metal Impregnation Plant?

Designed for industrial leak-proofing and casting quality enhancement, our **vacuum pressure metal impregnation plant** delivers consistent sealing performance, robust construction, and reliable long-term operation. We offer **customized capacities, automation solutions, and after-sales support** for foundries and engineering manufacturers.

10.Capacitor Oil Impregnation Plant

Our **Capacitor Oil Impregnation Plant** is a precision-engineered industrial system designed for the **vacuum drying, degassing, and oil impregnation of power capacitors, capacitor elements, and insulation assemblies**. The plant ensures deep and uniform penetration of insulating oil into the capacitor winding and dielectric material, eliminating trapped air, residual moisture, and gases that can affect electrical performance.

Using advanced **high-vacuum technology, controlled oil heating, and vacuum oil filling systems**, the plant improves the dielectric strength, insulation reliability, and service life of capacitors used in power transmission, distribution, and industrial electrical applications. The process enables efficient impregnation of dielectric paper and internal elements to ensure stable capacitance and long-term operational safety.

Widely used by **capacitor manufacturers, electrical OEMs, power equipment manufacturers, and service providers**, this plant is ideal for **power capacitors, capacitor banks, HT/LT capacitors, and specialty electrical capacitor assemblies**.

Key Features of Capacitor Oil Impregnation Plant

- High-vacuum **oil impregnation and drying system**
- Efficient removal of air, moisture, and dissolved gases
- Controlled oil heating and circulation system
- Uniform impregnation of dielectric paper and windings
- Precision vacuum chamber for capacitor elements
- PLC / HMI based automatic control system
- Oil storage, filtration, and transfer arrangement
- Heavy-duty leak-proof chamber construction
- Energy-efficient and low maintenance design
- Available in customized chamber sizes and capacities

Applications

Our **Capacitor Oil Impregnation Plant** is ideal for:

- Power capacitor manufacturing
- Capacitor bank element impregnation
- HT / LT capacitor insulation treatment
- Dielectric paper oil filling
- Electrical capacitor repair and refurbishment
- Specialty industrial capacitor applications

Benefits

- Improves dielectric strength
- Enhances insulation reliability
- Removes trapped air and moisture
- Improves thermal stability
- Reduces failure and breakdown risk
- Ensures long service life
- Improves overall capacitor performance

Why Choose Our Capacitor Oil Impregnation Plant?

Designed for high-reliability electrical applications, our **capacitor oil impregnation system** delivers precise vacuum performance, controlled oil handling, and consistent impregnation quality. We offer **customized capacities, automation options, and long-term service support** for capacitor manufacturers and power sector clients.

11.Oil Impregnation Plant | Vacuum Oil Impregnation System

Leading manufacturer and supplier of oil impregnation plants for Sintered Products, Bushing, capacitors, electrical coils, and insulation component applications.

Oil Impregnation Plant | Vacuum Oil Impregnation System

Our **Oil Impregnation Plant** is a high-performance industrial system designed for the **vacuum-assisted oil impregnation of electrical components, transformer windings, capacitors, coils, bushings, and insulation assemblies**. The plant ensures deep and uniform penetration of insulating oil into porous insulation materials, eliminating trapped air and moisture to improve dielectric performance and product reliability.

Using advanced **vacuum impregnation and controlled oil filling technology**, the system removes air pockets from the insulation structure and enables complete oil absorption into paper, pressboard, windings, and other porous components. This process significantly enhances **insulation strength, heat dissipation, moisture resistance, and service life**.

Widely used by **transformer manufacturers, capacitor manufacturers, electrical OEMs, repair workshops, and power equipment service providers**, the plant is ideal for high-voltage and medium-voltage electrical applications where insulation integrity is critical.

Key Features of Oil Impregnation Plant

- Advanced **vacuum oil impregnation system**
- Deep penetration of insulating oil
- Effective removal of trapped air and moisture
- Controlled oil heating and circulation system

- High-vacuum chamber for uniform impregnation
- PLC / HMI based automatic control system
- Oil storage, transfer, and filtration arrangement
- Heavy-duty chamber and piping construction
- Energy-efficient and low maintenance design
- Custom chamber sizes and capacities available

Applications

Our **Oil Impregnation Plant** is ideal for:

- Transformer winding impregnation
- Capacitor oil filling and impregnation
- Coil and bushing insulation treatment
- Pressboard and paper insulation impregnation
- Electrical component manufacturing
- Repair and refurbishment applications
- High-voltage insulation processing

Benefits

- Improves dielectric strength
- Removes trapped air and moisture
- Enhances insulation reliability
- Improves thermal conductivity
- Reduces failure risk
- Extends equipment life
- Ensures consistent product quality

Why Choose Our Oil Impregnation Plant?

Designed for critical electrical insulation applications, our **vacuum oil impregnation plant** offers reliable vacuum performance, precise oil handling, and uniform impregnation quality. We provide **customized plant capacities, automation options, and long-term service support** for transformer and electrical equipment manufacturers.

12.Epoxy Mixing Plant

Our **Epoxy Mixing Plant** is a precision-engineered industrial system designed for the **accurate mixing, dosing, degassing, and dispensing of epoxy resin and hardener**

systems used in electrical insulation, transformer casting, potting, encapsulation, and industrial manufacturing applications. The plant ensures homogeneous mixing of resin and hardener in the correct ratio, resulting in superior product quality and consistent curing performance.

Using advanced **vacuum mixing, temperature-controlled heating, and automatic metering technology**, the system eliminates air bubbles and ensures uniform blending of epoxy components. This process improves **mechanical strength, electrical insulation, thermal stability, and long-term reliability** of the final product.

Widely used by **transformer manufacturers, dry-type transformer OEMs, electrical equipment manufacturers, motor and generator companies, and casting industries**, the epoxy mixing plant is ideal for **transformer coil casting, bushings, CT/PT components, insulators, and potting applications**.

Key Features of Epoxy Mixing Plant

- Precision **epoxy resin and hardener dosing system**
- Accurate mixing ratio control
- Vacuum degassing to remove entrapped air
- Temperature-controlled resin heating system
- Homogeneous mixing for consistent curing
- PLC / HMI based automatic control system
- Continuous or batch process operation
- Stainless steel mixing and storage tanks
- Low maintenance and energy-efficient design
- Custom capacities and automation options available

Applications

Our **Epoxy Mixing Plant** is ideal for:

- Dry-type transformer coil casting
- Electrical insulation casting
- CT / PT resin casting
- Bushing manufacturing
- Potting and encapsulation
- Insulator production
- Industrial component sealing and bonding

Benefits

- Ensures uniform epoxy mixing
- Eliminates air bubbles and voids

- Improves dielectric strength
- Enhances mechanical bonding
- Improves curing consistency
- Reduces product rejection
- Increases reliability and service life

Why Choose Our Epoxy Mixing Plant?

Designed for high-precision industrial applications, our **epoxy resin mixing and dispensing plant** offers accurate dosing, efficient vacuum degassing, and consistent batch quality. We provide **customized plant capacities, automation solutions, and long-term technical support** for transformer and electrical equipment manufacturers.

13.Transformer Oil Handling System

Leading manufacturer and supplier of transformer oil handling systems for oil storage, transfer, circulation, filtration, and filling applications.

Our **Transformer Oil Handling System** is a high-performance industrial solution designed for the **safe storage, transfer, circulation, filtration, heating, and filling of transformer insulating oil** during manufacturing, testing, commissioning, and maintenance processes. The system ensures efficient oil management while maintaining oil cleanliness, moisture control, and dielectric performance.

Engineered with advanced **oil transfer pumps, filtration units, storage tanks, heating systems, and piping manifolds**, the plant enables smooth handling of transformer oil from bulk storage to final filling. It is ideal for maintaining the required **BDV (Breakdown Voltage), moisture level, and oil purity** during critical transformer operations.

Widely used by **transformer manufacturers, power utilities, repair workshops, service providers, and EPC contractors**, the system supports **power transformers, distribution transformers, reactors, OLTC systems, and other oil-filled electrical equipment**.

The system is suitable for **oil filling, circulation, filtration, and transfer operations** in transformer manufacturing and field service.

Key Features of Transformer Oil Handling System

- Efficient **oil transfer and circulation system**
- Integrated **filtration and moisture control**
- Insulated oil storage and buffer tanks

- Oil heating and temperature control arrangement
- High-capacity oil transfer pumps
- Multi-line piping and valve manifold system
- PLC / HMI based automatic control system
- Leak-proof and safe industrial design
- Portable or stationary skid-mounted models available
- Custom capacities and layout options

Applications

Our **Transformer Oil Handling System** is ideal for:

- Transformer oil storage and transfer
- Pre-filling oil circulation
- Transformer manufacturing lines
- Transformer testing setups
- Utility maintenance and servicing
- Oil top-up and replacement
- On-site commissioning support

Benefits

- Maintains oil cleanliness and BDV
- Reduces contamination risk
- Improves oil handling efficiency
- Ensures smooth manufacturing flow
- Reduces oil wastage
- Enhances transformer reliability
- Lowers maintenance downtime

Why Choose Our Transformer Oil Handling System?

Designed for critical transformer manufacturing and service applications, our **oil handling systems** deliver reliable performance, safe oil movement, and long-term durability. We provide **customized tank capacities, pump sizes, automation options, and complete piping solutions** based on customer requirements.

14.Oil Storage Tank

Our **Oil Storage Tank** is a robust and high-performance industrial storage solution designed for the **safe storage, heating, and controlled handling of transformer insulating oil, industrial oils, and dielectric fluids**. Engineered for reliability and long service life, the tank

is widely used in **transformer manufacturing plants, oil filtration systems, testing setups, and maintenance facilities**.

The tank is fabricated using **heavy-duty mild steel or stainless steel construction** with optional insulation, heating arrangement, level indicators, and oil transfer connections. It is designed to preserve oil quality by minimizing contamination, moisture ingress, and temperature fluctuations, ensuring the required **BDV (Breakdown Voltage) and dielectric properties** are maintained.

Widely used by **transformer manufacturers, service providers, utilities, repair workshops, and power sector industries**, the oil storage tank is ideal for **bulk oil storage, buffer storage, oil circulation systems, and oil transfer applications**.

Key Features of Oil Storage Tank

- Capacity range: 5 KL to 100 KL (with pump, hoses & control panel)
- Stationary, mobile, or truck / trolley-mounted designs
- Insulated or non-insulated construction
- Customized configurations as per requirement
- Heavy-duty MS / SS tank construction
- Suitable for transformer oil and other dielectric fluids
- Available in vertical and horizontal designs
- Optional oil heating and insulation system
- Oil level gauge and sight glass provision
- Flanged inlet and outlet connections
- Leak-proof welded construction
- Corrosion-resistant surface coating
- Custom capacities and dimensions available
- Compatible with oil handling and filtration systems

Applications

Our **Oil Storage Tank** is ideal for:

- Transformer oil storage
- Bulk oil buffer tank
- Oil filtration system integration
- Oil transfer and circulation systems
- Transformer testing setups
- Maintenance and service workshops
- Utility and power plant use

Benefits

- Safe and contamination-free oil storage

- Maintains oil purity and BDV
- Reduces moisture ingress risk
- Supports smooth oil transfer operations
- Improves process efficiency
- Durable and long service life
- Low maintenance design

Why Choose Our Oil Storage Tank?

Designed for critical transformer and industrial oil applications, our **oil storage tanks** provide reliable storage performance, strong fabrication quality, and customized design options. We offer **tank capacities, heating arrangements, and connection layouts as per customer requirements**.
